Für andere Schwerpunktabstände Lx errechnet sich die zulässige Gewichtskraft F_{zul} aus der Näherungsformel:
Other centre to centre distances Lx, the permitted weight load F_{zul} can be calculated acc. to the approximation formula:

$$F_{zul} = F + 0.5 F \left(\frac{L}{Lx} - 1 \right) \quad \text{Max. zulässige Betriebstemperatur } +80^\circ\text{C, kurzzeitig } +100^\circ\text{C}$$

Max. permitted operating temperature +80 °C, for short periods +100 °C

MONOBLOC-PUMPENTRÄGER, GEDÄMPFT NACH VDMA 24 561

MONOBLOC-BELLHOUSINGS WITH NOISE DAMPER ACC. TO VDMA 24 561

Hersteller von Hydraulik-Zubehör haben bekanntlich keinen Einfluss auf den Geräuschcharakter einer Pumpe. Die Beeinflussung von Luftschall und Flüssigkeitsschall und auch des Körperschalls einer Pumpe obliegt dem Pumpenkonstrukteur.

Der Geräuschcharakter einer Pumpe – bestehend aus Grundfrequenz und Oberwellen – kann besonders unangenehm werden, wenn sich der Körperschall in andere Bauelemente eines Hydraulikaggregates und hiermit verbundene Maschinenelemente fortpflanzt. Die Volumenpulsation und somit Druckpulsation einer Pumpe kann zu besonders unangenehmen Strukturresonanzen führen, welche teilweise selbst durch eine Schalldruckpegelmessung in Form des dB(A)-Wertes nicht immer umfassend zum Ausdruck kommen.

Zur Vermeidung der Fortpflanzung dieser Pulsion in andere Bauelemente ist eine weitestgehende Körperschalttrennung zu erwirken. Neben der erforderlichen Verwendung einer drehelastischen Kupplung – wie der SPIDEX®-Kupplung – und von Druckschlüchen anstelle von Verrohrungen, geschieht die wesentliche Körperschalttrennung mittels eines gedämpften Pumpenträgers. Derartige Dämpfungsflansche enthalten ein Elastomer, welches den metallischen Kontakt zwischen Pumpe und den übrigen Elementen eines Hydraulikaggregates verhindert.

Die Firma R+L HYDRAULICS fertigt und vertreibt Dämpfungsflansche zur Geräuschreduzierung von Hydraulikaggregaten. Aufgrund der langjährigen Erfahrung hat R+L HYDRAULICS ein gedämpftes Monobloc-Pumpenträgersystem (Abb. 4) entwickelt, welches eine wesentliche Vereinfachung gegenüber der üblichen Bauweise bietet. Die Verbindung zwischen Dämpfungsring und Pumpenträger erfolgt jetzt gänzlich ohne Verschraubungen. Vielmehr wird der Pumpenflansch direkt durch eine formschlüssige, an vulkanisierte Elastomer-Verbindung (sowohl in Drehrichtung als auch als Radialabstützung) unmittelbar mit dem eigentlichen Pumpenträger verbunden.

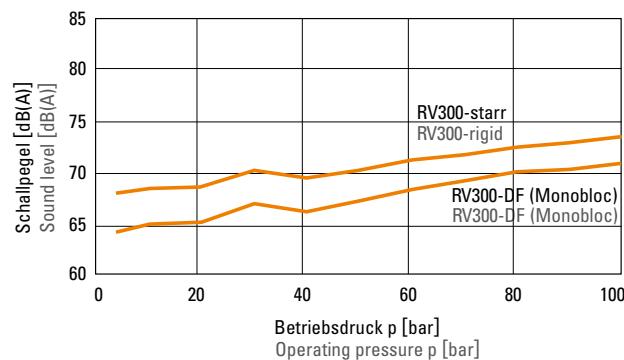

Abb. 1 Schalldruckpegelmessung Flügelzellenpumpe
Fig. 1 Sound-pressure level monitoring vane pump

Das Ergebnis ist eine deutlich verbesserte Steifigkeit in Verbindung mit hervorragenden Dämpfungseigenschaften. Bei einem Monobloc-Pumpenträger mit Motorflanschdurchmesser 300 mm, passend zu einem E-Motor, Baugröße 132, ergibt sich beispielsweise eine Zerreißkraft von 56 kN. Die höhere Steifigkeit bewirkt vor allem geringere Verlagerungswerte und somit eine höhere Lebensdauer der Kupplung.

Der Dämpfungseffekt des Monobloc-Pumpenträgers ist nicht nur abhängig von dem speziellen Einsatzfall, sondern auch von dem Geräuschcharakter der Pumpe. Je unangenehmer das Pumpengeräusch, desto höher der Dämpfungsgrad. Das Spektrum der Schallpegelreduzierung liegt in der Regel zwischen 3 dB(A) bei geräuschrämeren Pumpen (Abb. 1) und über 10 dB(A) bei Pumpen (Abb. 2), welche ein unangenehmeres „Geräuscherlebnis“ vermitteln.

It is a well-known fact, that manufacturers of hydraulic accessories have no influence at all upon the noise characteristics of a pump. The influence of air sound and liquid sound, but also that of structure-borne noise is incumbent on the pump design engineer himself.

The noise characteristics of a pump – consisting of basic frequency and harmonic waves – can become very annoying, when the structure-borne noise of the hydraulic unit and that of the herewith integrated elements of the machine are propagated. The volume vibration of a pump, and with it the pressure vibration, can cause a particularly unpleasant resonance of the structure, which itself cannot always be expressed, even by means of a sound-pressure level monitoring in form of a dB(A)-value.

In order to prevent the propagation of this vibration into other integrated elements as far as possible, the separation of the structure-borne noises is to be achieved. And, apart from having to use a flexible coupling – like a SPIDEX® coupling – and pressure piping instead of the conventional one, the structure-born noises will be essentially separated through the implementation of bell-housings with noise damper. Damper flanges of this type contain an elastomer, which hinders the metallic contact between the pump and the other elements of the hydraulic unit.

The company R+L HYDRAULICS manufactures and distributes damper flanges for the noise reduction of hydraulic units. On account of its many years of experience in this field, R+L HYDRAULICS has developed a monobloc bellhousing system with noise damping (Fig. 4), which offers an essential simplification towards the conventional construction. The connection between the noise damper ring and the bellhousing is now totally made without bolting. Rather more, the pump flange is directly combined with the bellhousing by means of a form-conclusive and vulcanised elastomer compound (as well in the sense of rotation as in the radial back-up).

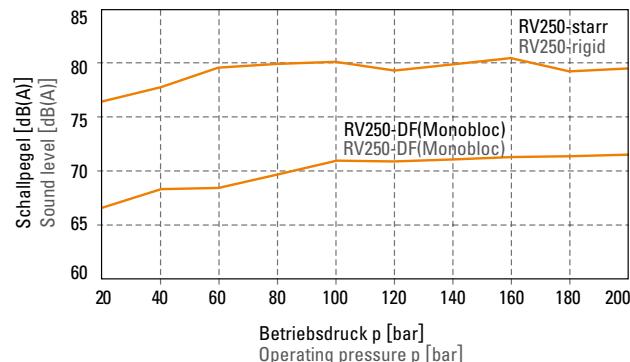

Abb. 2 Schalldruckpegelmessung Außenzahnradpumpe
Fig. 2 Sound-pressure level monitoring external gear pump

The result is a significant improvement of the stiffness, in combination with first rate noise damping characteristics i.e. meaning a tensile strength of 56 kN, in the case of a monobloc-bellhousing with a motor flange diameter of 300 mm, suitable for an E-motor frame size 132. The higher stiffness results especially in lesser misalignments, which go together with a higher service life of the coupling.

The noise damping effect of the monobloc-bellhousing does not only depend on the special field case but also on the noise characteristics of the pump. The more annoying the pump's noise is, the higher the damping degree will be. The spectrum of soundlevel reduction generally lies between 3 dB(A) in the case of less noisy pumps (Fig. 1) and more than 10 dB(A) by pumps (Fig. 2), which procure a more annoying "noise-experience".

PUMPENTRÄGER AUS GRAUGUSS GG-25

BELLHOUSINGS MADE OF CAST IRON GG-25

Pumpenträger aus Grauguss sind speziell für folgende Anwendungen entwickelt worden:

- Hohe Belastungen
- Mobilhydraulik
- Bergbau, Offshore
- Servomotorische Antriebe

Aufgrund der hohen Masse gute Geräuschdämpfungseigenschaften.

Starre Ausführung GG-RV

Werkstoff: EN-GJL-250

$\varnothing D1 = 250 - 660$ mm

Ab Lager verfügbar

Andere Größen auf Anfrage

Montageanleitung beachten

Bellhousings made of cast iron are especially developed for the following applications:

- High loads
- Mobile hydraulic
- Mining, Offshore
- Servomotorical drives

Based on the high weight, good noise reduction performance.

Rigid version GG-RV

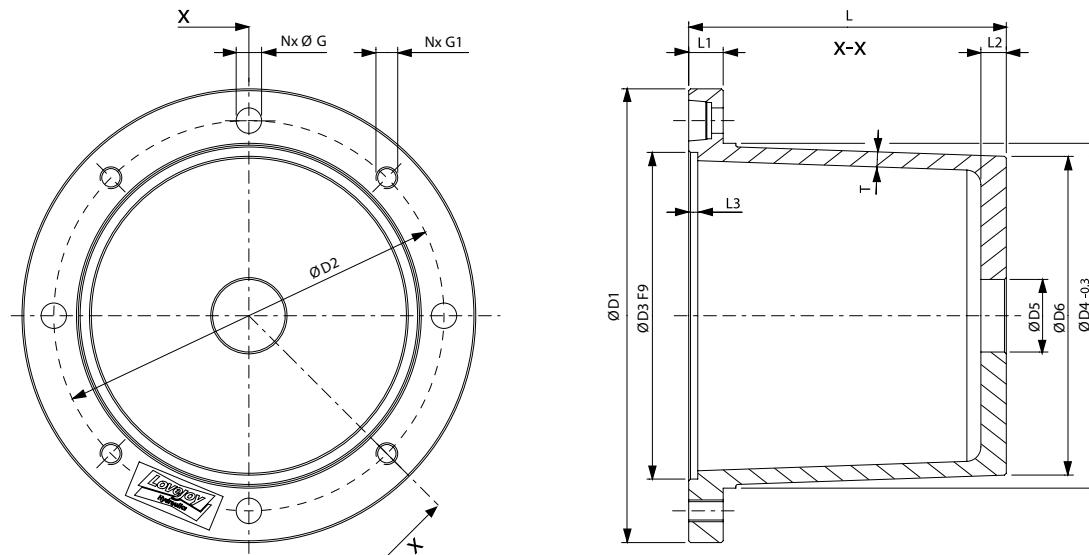

Material: EN-GJL-250

$\varnothing D1 = 250 - 660$ mm

Available from stock

Other sizes on request

Consider operation manual

Leckage- bzw. Montagebohrungen sind bei der Bestellung anzugeben.

Leakage- or inspection holes respectively have to be specified with the order.

PUMPENTRÄGER FÜR ZAHNRADPUMPEN
BELLHOUSINGS FOR GEAR PUMPS

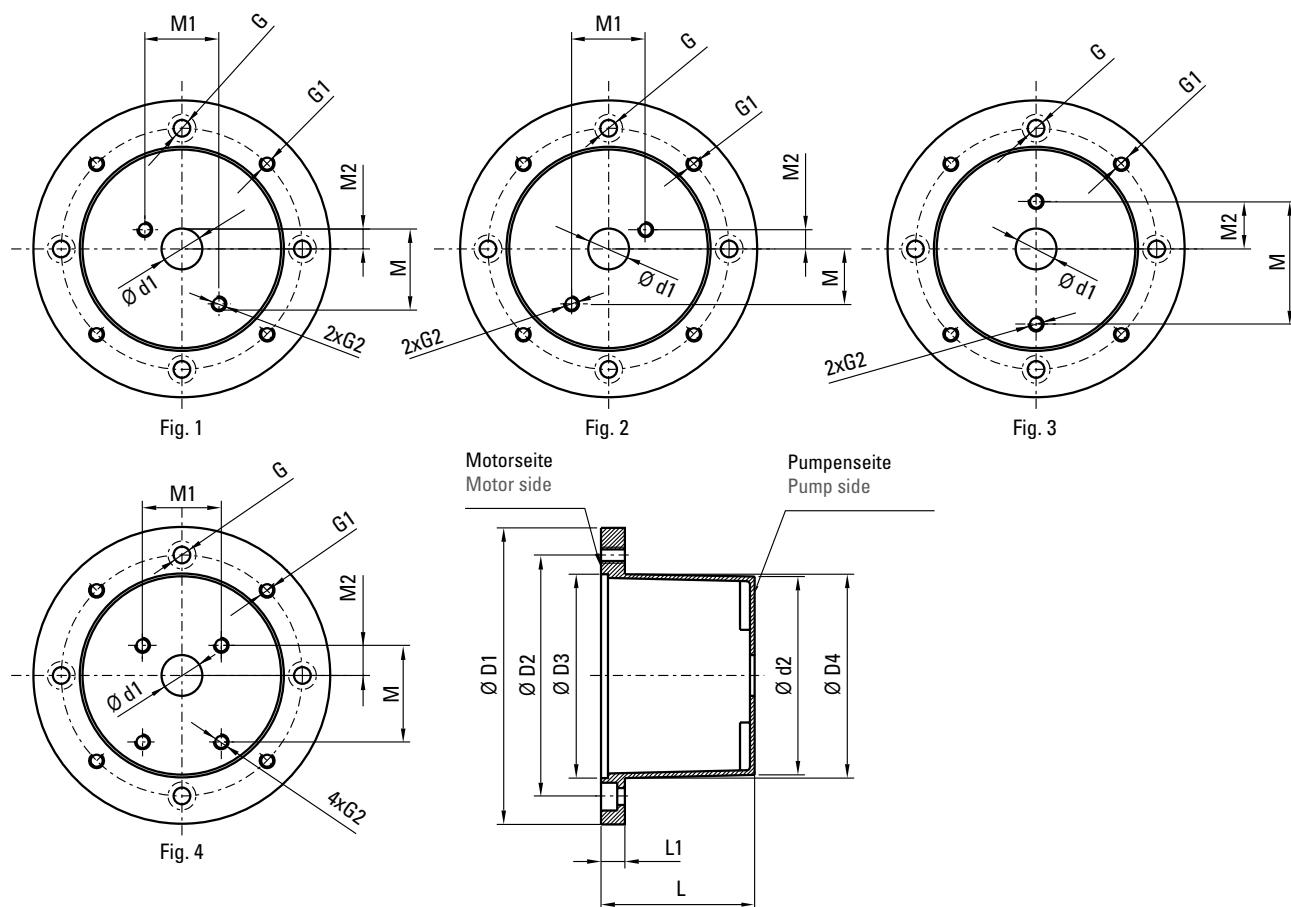

PRODUKTEIGENSCHAFTEN
FEATURES

- Motorbundhöhe gemäß VDMA 24 561
- Kombinierbar mit Fußflanschen nach VDMA 24 561
- Motorflanschdurchmesser von 160–400 mm
- Height of motor flange acc. to VDMA 24 561
- Optional combination with footbrackets acc. to VDMA 24 561
- Motor flange diameter from 160–400 mm

Kühlleistung der Serie KPV in Korrelation zur installierten Motorleistung

- Die zulässige Nenndrehzahl⁽¹⁾ für die Antriebsmaschine beträgt 1500 1/min. Andere Drehzahlen nur nach Rücksprache mit dem Hersteller.
- Schallpegel⁽²⁾ der gedämpften Ausführung gemessen mit Pumpenträger und E-Motor in 1 m Abstand zum Prüfling. Die angegebenen Werte sind als Anhaltswerte zu betrachten, da der tatsächliche Schallpegel abhängig vom eingesetzten Elektromotor schwankt.
- Drehrichtung der Pumpe grundsätzlich **rechts (auf die Pumpenwelle gesehen)**.

Cooling capacity of the series KPV in correlation to the capacity of the installed engine.

- Nominal rotation⁽¹⁾ of driven machine 1500 1/min. In case of different rpm please contact the manufacturer.
- Noise levels⁽²⁾ of damped version are measured with bellhousing and electric motor. Distance to the tested object 1 m. The a. m. values of noise level will be various depending on used electric motor.
- Direction of pump rotation always **clockwise (looking on pump shaft)**.

KÜHPUMPENTRÄGER VDMA-KOMPATIBEL, RESISTENT GEGEN DRUCKSPITZEN COOLER BELLHOUSING VDMA COMPATIBLE, RESISTANT TO PRESSURE PEAKS

Kühlpumpenträger haben mittlerweile breiten Eingang in die Ölhydraulik gefunden. Die Firma R+L HYDRAULICS GmbH stellt eine innovative Baureihe von Kompakt-Kühlern vor, welche über ein reines „face-lifting“ weit hinausgeht und dem Anwender wesentliche Vorteile bietet – die Kühlpumpenträger Serie KPV.

Nachdem die anfangs auf dem Markt erhältlichen Kühlpumpenträger in der Regel mit einem Rippenrohr als Wärmetauscher bestückt waren, was diese – abgesehen von der unbefriedigenden Kühlleistung – überwiegend auf die Leckölkühlung beschränkte, ist die Verwendung prismatischer Kühlelemente heute Stand der Technik. R+L HYDRAULICS hat als erster Hersteller katalogmäßige Kühlpumpenträger mit prismatischen Standard-Kühlelementen eingesetzt. Bei dem hierdurch möglichen Einbau der Kühler in die überwiegend drucklose Rücklaufleitung kann es jedoch bei bestimmten Konstellationen zu Druckspitzen kommen, welche mit herkömmlichen Druckmessgeräten nicht zu ermitteln sind.

Dieses ist z.B. häufig der Fall, wenn ein druckbeaufschlagter Zylinder im Millisekundenbereich durch ein Elektromagnetventil zur Rücklaufleitung hin entlastet wird. Durch Massenträgheit und Reibung ist es vielfach nicht möglich, die entstehende Druckspitze vom Kühler fernzuhalten, was in der Vergangenheit bei periodisch wiederkehrenden Druckspitzen gelegentlich zum Ausfall des Wärmetauschers führte.

DYNAMISCHE DRUCKBESTÄNDIGKEIT DYNAMIC RESISTANCE TO PRESSURE

Bei der Konzeption der neuen KPV-Baureihe war es deshalb oberstes Gebot, ein Kühlelement zu integrieren, welches ohne Einbußen in der Kühlleistung dynamischen Druckbelastungen standhält. Mittels dynamischer Dauerbelastungsversuche wurde ein Kühlelement entwickelt, welches der anwenderbezogenen Vorgabe von Druckspitzen bis zu einer Höhe von 16 bar dauerhaft standhält (Abb. 1).

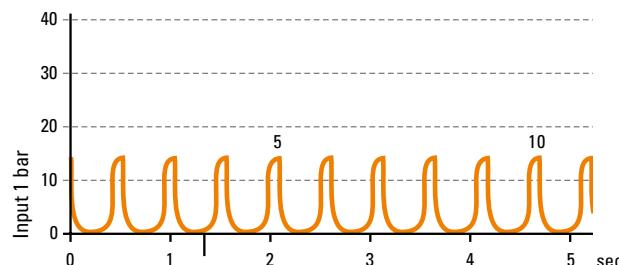

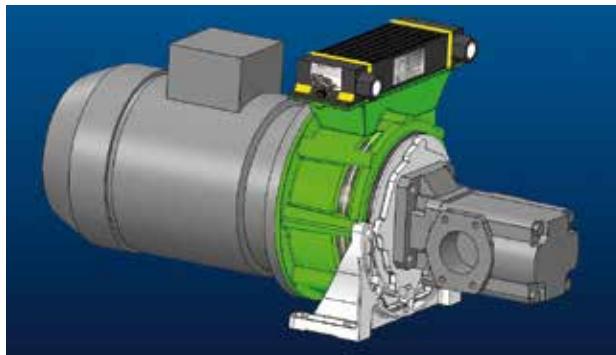

Abb. 1) Dauerbelastungs-Druckversuche mit Kühlelementen für die R+L HYDRAULICS-Serie KPV bei 16 bar mit 1 x 106 Lastspielen und f = 2 Hz
Fig. 1) Dynamic fatigue strain tests with cooling elements for the R+L HYDRAULICS-series KPV at 16 bars with 1 x 106 stress cycles and f = 2 Hz

Kühlpumpenträger, Serie KPV
Cooler bellhousing, series KPV

Cooler bellhousings are meanwhile well established in the oil hydraulic. The company R+L HYDRAULICS GmbH presents an innovative series of compact coolers, which reaches far beyond a plain “face-lifting” and offers the users substantial advantages – the cooler bellhousing series KPV.

Since the first cooler bellhousings on the market were usually equipped with a finned tube as heat exchanger, which – regardless of the unsatisfactory cooling power – chiefly limited to leakage oil cooling, is the application of prismatic cooling elements state-of-the-art today. The herewith given possibility to build the cooler into the mainly pressureless return pipe can however be the cause for pressure peaks, which cannot be detected with customary pressure measuring devices. R+L HYDRAULICS, that was the first manufacturer to bring in cooler bellhousings with prismatic standard cooling elements from catalogue.

This is often the case, for instance, when a cylinder under pressure will be unloaded within milliseconds by means of an electromagnetic valve to the return pipe. Because of inertia and friction, it is frequently not possible to protect the cooler from the resulting pressure peak, which has in the past led to occasional breakdowns of the temperature exchanger in the case of recurring pressure peaks.

It became therefore top priority, during the development of the new series KPV, to integrate a cooling element, which withstands dynamic pressure loads without loss of cooling power. According to users' requirements and by means of dynamic fatigue strain tests, a cooling element has been developed, which continually withstands pressure peaks up to 16 bars (Fig. 1).

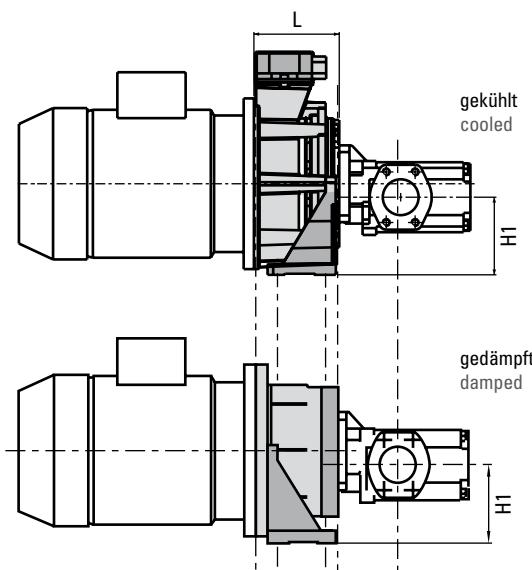

Abb. 2) Austauschbarkeit der Bauweisen starr, gedämpft, gekühlt nach VDMA 24 561

Fig. 2) Interchangeability of configurations rigid, damped, cooled acc. to VDMA 24 561

DYNAMISCHE DRUCKBESTÄNDIGKEIT (FORTSETZUNG)

DYNAMIC RESISTANCE TO PRESSURE (CONTINUED)

1×10^6 Lastspiele werden in der Regel als ausreichend angesehen. Da die Anzahl der Druckspitzen pro Zeiteinheit jedoch im Einzelfall sehr unterschiedlich sein kann, lässt sich schwerlich bestimmen, welcher Lebensdauer 10^6 Lastspiele entsprechen. Insofern wurden einige Prüfzyklen auf 3.5×10^6 Lastspiele ausgedehnt. Auch in diesen Fällen ergaben sich keine Beanstandungen.

Außerdem wird jeder einzelne Wärmetauscher während der Fertigung mit 40 bar druckgeprüft, was auch dem maximal zulässigen statischen Druck der Kühelemente entspricht. Des Weiteren wurde bei der Neukonzeption darauf geachtet, dass das Kühelement gegen äußere Beschädigungen geschützt in das stabile Gussgehäuse des KPV-Kühlers eingebettet ist.

As a rule, 1×10^6 stress cycles will be considered sufficient. However, since the number of pressure peaks per time period can be extremely variable in isolated cases, it is difficult to determine which service life 10^6 stress cycles correspond to. From that point of view, some of the testing have been extended to 3.5×10^6 stress cycles. In these cases as well, all established results have been satisfactory.

In addition to that, each single heat exchanger will be tested at 40 bar during production, which is equivalent to the highest authorized static pressure for cooling elements. Furthermore, when it came to developing a new concept, great attention has been brought to protecting the cooling element against external damages by embedding it in the sturdy cast-iron casing of the KPV-cooler.

KÜHLLEISTUNG

COOLING CAPACITY

Aufgrund der einfachen Installation, des platzsparenden Aufbaus und der Einsparung eines elektrischen Lüfterantriebes, haben Kühpumpenträger zwischenzeitlich breiten Eingang in die Ölhydraulik gefunden, da sie in der Regel den Kühlerfordernissen hinreichend gerecht werden.

Bei Abwesenheit einer externen Wärmequelle rechnet man bei Hydraulikaggregaten bei durchschnittlichen Wirkungsgraden mit Wärmeverlusten von 30 bis 40 % der installierten Motorleistung. Die Wärme, die nicht bereits durch die einzelnen Komponenten des Aggregates, vor allem den Tank, abgegeben wird, muss somit zwecks Vermeidung einer Ölüberhitzung mittels eines zusätzlichen Kühlers abgeführt werden. Auch bei kleineren Tankkapazitäten, beispielsweise im Werkzeugmaschinenbau oder in mobilen Einsatzfällen, hat sich größtenteils eine durchschnittliche zusätzliche Kühlleistung von 20 bis 30 % der installierten Motorleistung als ausreichend erwiesen. Die Kühlleistung der R+L HYDRAULICS-Kühlpumpenträger der Serie KPV erfüllt weitestgehend diese Vorgabe.

Die Abhängigkeit der Kühlleistung von der Öldurchflussmenge ergibt sich aus Abb. 3. Die spezifischen Werte pro $1\text{ K} \Delta t$ ermöglichen die einfache Umrechnung der tatsächlichen Kühlleistung durch Multiplikation mit dem jeweiligen Δt .

Since as a rule they amply fulfil the cooling requirements, cooler bellhousings are meanwhile well established in the oil hydraulic, on account of the easy installation, the space-saving construction and upon the fact that no electric ventilation drive is required.

In the absence of an external source of thermal input, temperature loss of 30 to 40 % of the installed engine performance will be estimated by pump and motor units of average efficiency. All heat, which is not already radiated by the individual components of the unit, especially the tank, will therefore have to be carried off by means of an additional cooler in order to avoid an overheating of the oil. Even by smaller tank capacities, for instance in machine tooling or in mobile operational cases, an average cooling power of 20 to 30 % of the installed engine's power has proved to be largely sufficient. The cooling power of the R+L HYDRAULICS-cooler bellhousings of the series KPV fulfills this requirement.

The interdependence between the cooling power and the flowing quantity of the oil follows out of fig. 3. The specific values per $1\text{ K} \Delta t$ allow the simple conversion of the actual cooling power by multiplication with the respective Δt .

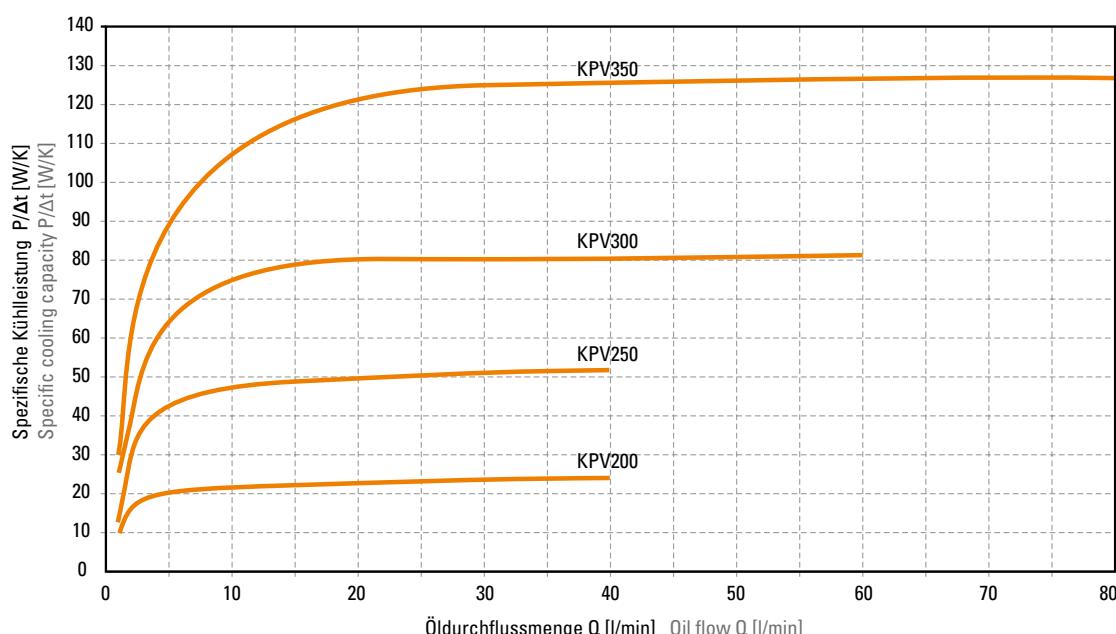

Abb. 3:
Spezifische Kühlleistung P/t der Serie KPV in Abhängigkeit vom Öldurchfluss Q und der Temperaturdifferenz $\Delta t = 1\text{ K}$ (Öleintritt zu Lufteintritt).

Fig. 3:
Specific cooling power P/t of the series KPV depending on oil flow Q and temperature difference $\Delta t = 1\text{ K}$ (oil inlet to air inlet).

AUSTAUSCHBARKEIT NACH VDMA 24 561

INTERCHANGEABILITY ACC. TO VDMA 24 561

Eine weitere Vorgabe für die Konzeption der innovativen R+L HYDRAULICS-Serie KPV war die volle Austauschbarkeit der Einbaumaße nach VDMA 24 561; und zwar nicht nur nach der Einbaulänge, sondern auch nach der Befestigungsposition der Fußverschraubung.

Dieses erlaubt nicht nur die Beibehaltung des gesamten Aufbaus inklusive Verrohrung im Falle von nachträglich erforderlichem Kühlereinsatz. Es erlaubt auch den Projekteuren von hydraulischen Anlagen, sich zu jedem späteren Zeitpunkt für das Erfordernis einer Kühlung mit und ohne Geräuschdämpfung zu entscheiden (siehe Abb. 2, Seite 26).

Der R+L HYDRAULICS-Kühlpumpenträger Serie KPV lässt sich sowohl in Horizontalbauweise IMB 35 als auch IMB 5 einbauen, dieses wiederum sowohl mit vertikalem als auch seitlichem Kühlluftaustritt. Ebenso ist der KPV in vertikaler IMV1-Bauweise montierbar.

A further guideline in the conception of the innovative R+L HYDRAULICS-series KPV was the full interchangeability of the mounting dimension acc. to VDMA 24 561 and that, not only according to the fitting length, but also according to the fastening position of the foot brackets.

This does not only make it possible to keep the complete installation, hydraulic piping inclusive, should the use of a cooler become necessary at a later stage. It also allows someone planning hydraulic installations, to decide on the requirements for a cooling with and without noise damper at a later point (see fig. 2, page 26).

The cooler bellhousing series KPV can be mounted horizontally IMB 35-version and IMB 5-version, and with vertical as well as with lateral cooling air discharge. But the KPV can just as well be mounted vertically – IMV1-version.

Die volle Belastbarkeit wird nur erreicht, wenn alle vorhandenen Befestigungsbohrungen verschraubt werden!
 The full load capacity is reached, only if all mounting holes are being used!

VORTEILE BEI MONTAGE MIT FUSSFLANSCH

ADVANTAGES OF FOOTBRACKET ASSEMBLY

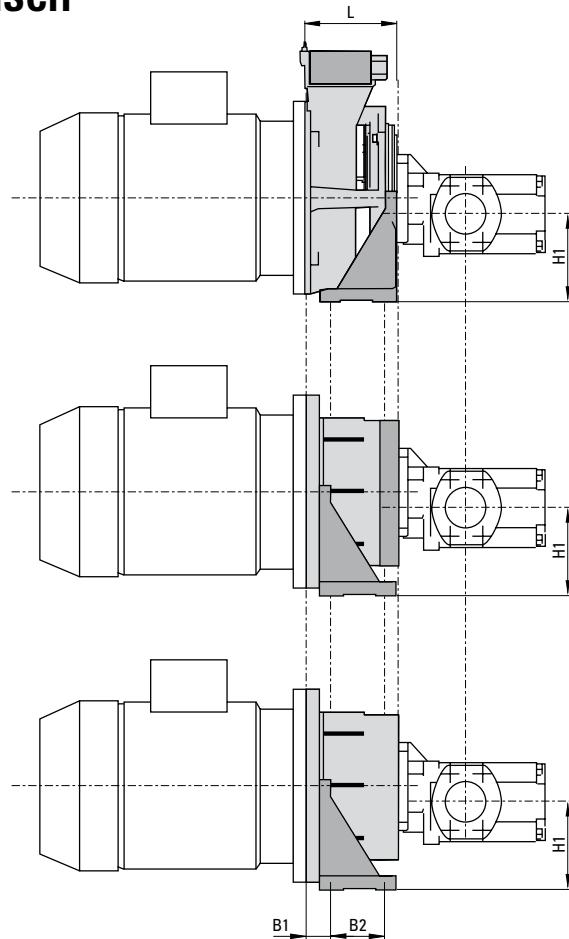

1. Reduzierung der Motor-Lagerhaltung auf IM B5/V
2. Einfacher Austausch des E-Motors.
3. Aufbau von Pumpe und Verrohrung auch ohne Motor möglich.
4. Die bei Fußmotoren teilweise notwendige Unterfütterung entfällt.

1. Storage reduction to electric motors, frame IM B5/V1 (without feet).
2. Simple exchange of the electric motor.
3. Assembly of pump and pipes without electric motors possible.
4. No shimming of motor feet.

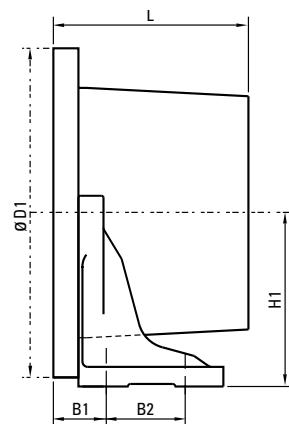

Das R+L HYDRAULICS-Konzept: starr, gedämpft, gekühlt
R+L HYDRAULICS – the general solution concept:
rigid, damped, cooled

Identische Einbaumaße L, B1, B2, H1 bei Verwendung der Fußflansch-Baureihe PTFL.

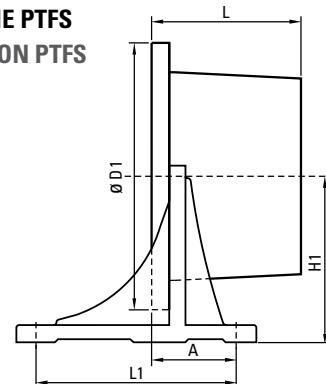

Identical dimensions L, B1, B2, H1 in case of using footbrackets series PTFL.

DAMPING RINGS

TYPENBEZEICHNUNG

MODEL TYPE

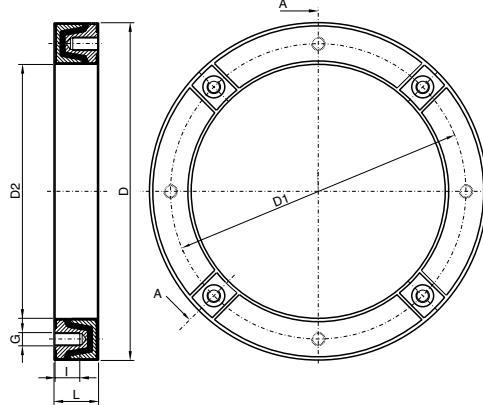

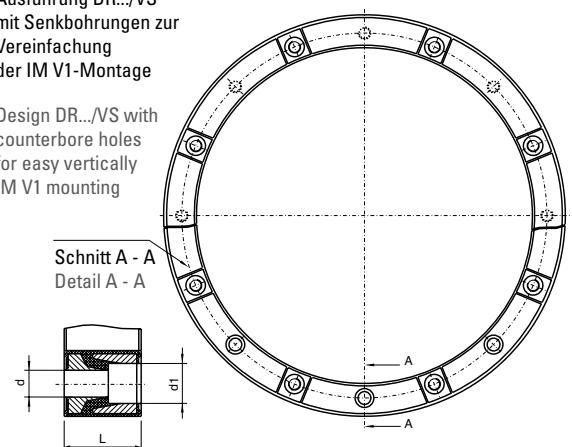

DR - V1 / B5 - 300 / VS

- Für vertikale und horizontale Montage
- Kostengünstige Schallreduzierung durch Entkopplung
- Mineralölbeständigkeit durch NBR-Gummimischung
- Anvulkanisierte Dichtlippe, keine zusätzliche Dichtung erforderlich
- Vertical and horizontal mounting
- Low cost noise level reducing as a result of rubber flexible separation
- Resistance against mineral-oil due to NBR-rubber
- Moulded ring-sealing, no additional sealing required

DÄMPFUNGSSCHIENEN

DAMPING RODS

PRODUKTEIGENSCHAFTEN

FEATURES

- Für Elektromotoren Bauform IM B35 und Fußflansche nach VDMA 24 561
- Ausgelegt für die Gewichtsbelastung bei horizontalem Einbau
- Schallreduzierend und schwingungsdämpfend
- Mineralölbeständigkeit durch NBR-Gummimischung

- For electric motors with frame size IM B35 and footbrackets acc. VDMA 24 561
- Dimensioned for loads in case of horizontal mounting
- Noise absorbing and vibration damping
- Resistance against mineral-oil because of NBR-rubber
